

Assessment comments

Example 4: Car management

Subject: DP Computer Science

Component: Internal Assessment—The computational solution

Assessment criteria	Marks awarded	Marks available	Comments
Criterion A: Problem specification	3	4	All three strands achieve in the upper descriptor, but none of them fully reach the command term objectives. The problem scenario has only one measurable requirement, some of the success criteria (SC) remain vague, and the choice of computational context has not been fully explained.
Criterion B: Planning	4	4	The decomposition is very reasonable. The plan includes a clear chronology, details of all five stages, and it is linked to the SC.
Criterion C: System overview	4	6	The system model is clear but incomplete (voice recognition and more database detail). The algorithms are clear but incomplete (sorting and searching). The testing strategy is quite good, but not perfect (e.g. SC 4 should include verification of the delete request and SC 7 should include checking the graph result after changing the data). Holistically, this criterion achieves in the middle descriptor.
Criterion D: Development	9	12	The video demonstrates partial functionality—search has only been shown by brand. Appropriate techniques have been used, though some are not very efficient (like retyping a full record to change one data item). Some elements of evaluation of implementation choices are present, but it is not pervasively addressed. The effectiveness of the testing strategy has been quite generically stated, which impacts the achievement in this criterion.
Criterion E: Evaluation	3	4	Meeting the success criteria has been described but not clearly evaluated. The improvements are acceptable with some aspects of justification presented.
Total	23	30	A solid project consisting of a basic, straightforward product (which is still challenging at standard level) and some very good documentation.
