

Assessment comments

Example 6: IB timetable

Subject: DP Computer Science

Component: Internal Assessment The computational solution

Assessment criteria	Marks awarded	Marks available	Comments
Criterion A: Problem specification	4	4	All three strands achieve in the upper descriptor. The problem scenario is reasonably described with some measurable requirements. The success criteria (SC) are sufficient and testable but not always specific. The choice of computational context has some elements of explanation but also some generic statements.
Criterion B: Planning	4	4	A reasonable, solid decomposition has been constructed. The plan clearly addresses the requirements in terms of the SC, and it also includes a chronology that includes all five stages.
Criterion C: System overview	5	6	All three strands achieve in the upper descriptor, but the documentation is lacking some detail. The system model is somewhat complete, but not extensive (no design of the format of the timetable). The algorithms are clear and support the solution created. The testing strategy aligns with the SC, but it is not always clear or complete.
Criterion D: Development	10	12	This assessment criterion shows very good documentation with a few comments. The solution appears fully functional, but the configuration file has not been integrated and must be maintained outside the solution. Appropriate techniques have been described (apart from the configuration file issue). There are elements of evaluation of the implementation choices. Effectiveness of the testing strategy has been somewhat described, but limited testing is shown in the video (especially of extreme and abnormal data).
Criterion E: Evaluation	3	4	Most but not all SC have been properly evaluated (SC 7 is inadequately implemented). There is an attempt at justification of two proper improvements, although there is not enough critical thinking to award the highest mark. Note that improvement 2 is considered to be trivial.
Total	26	30	The short video shows: limited test data, testing without extreme / abnormal data, no edit/delete, not fully integrated (the configuration file of subjects), the actual timetable is unclear, and the output format is unclear. Code has been included without comments. On the other hand, this work made a clear and genuine effort to address all the assessment criteria.
